

Fleet Tracker

A clear guide to what the system does -
written for business owners, managers, and operators.

What is Fleet Tracker?

Fleet Tracker is a GPS fleet management system that helps you see where your vehicles are, understand how they are being driven, keep maintenance on schedule, and stay informed when something needs attention - all from a simple web dashboard on desktop or phone.

Who this guide is for

Anyone who needs to understand the product without technical jargon - fleet owners, operations managers, supervisors, and vehicle owners. No IT background required.

1. What the System Helps You Do

Fleet Tracker brings your vehicles, drivers, trips, alerts, routes, and maintenance into one place. Instead of calling drivers or guessing where a vehicle is, you open the dashboard and see the current picture - live on a map, with history you can replay, and alerts when something goes wrong.

- **See live locations.** Know where every vehicle is right now.
- **Review history.** Replay past journeys and review completed trips.
- **Stay alert.** Get notified about speeding, leaving allowed areas, harsh driving, and more.
- **Account for work.** Confirm who drove each trip and which route was used.
- **Plan maintenance.** Track service due dates and log workshop visits.
- **Control access.** Give the right people the right access - owners, managers, and admins.

In plain terms

Think of it as a control room for your fleet: a live map, a trip logbook, a safety alarm system, a route planner, and a maintenance diary - working together.

2. Who Uses the System

Different people need different views. Fleet Tracker is organized around roles so each person only sees what they need, and nothing they should not.

Admin (Fleet Owner / Operations Lead)

Full control of one fleet: vehicles, users, drivers, managers, routes, geofences, settings, fuel prices, and reports.

- Adds and manages all vehicles and people in the fleet
- Sets permissions and notification rules
- Reviews dashboards, trips, alerts, and maintenance across the whole fleet

Manager (Supervisor)

Oversees a group of users and their vehicles. Sees dashboards, maps, trips, alerts, and maintenance for their team - based on permissions granted by Admin.

- Monitors assigned vehicles and drivers day to day
- Can confirm trip drivers and routes when allowed
- Receives alerts for the vehicles they supervise

User (Vehicle Owner / Operator)

Focused view of their own vehicle: live location, playback, trips, alerts, and maintenance - according to permissions.

- Tracks their vehicle on the map
- Reviews trip history and alerts for that vehicle
- Logs or reviews maintenance when permitted

Super Admin (Platform Operator)

Works across fleets: manages Admin accounts and can enter a specific fleet when support or setup is needed.

- Creates and oversees fleet Admins
- Handles unassigned or orphaned assets when needed
- Does not replace day-to-day fleet operations

3. Live Vehicle Tracking

See your fleet on the map

The live map shows where each vehicle is, whether it is moving, idle, or stopped, and key status at a glance. Positions refresh automatically so you are looking at near real-time information - typically updated every few seconds.

- **Location** - Current location on an interactive map
- **Motion status** - Moving, idle (engine on but not moving), or stopped
- **Speed** - Current speed in km/h
- **Heading** - Direction the vehicle is facing / traveling
- **Last seen** - When the vehicle last reported in
- **Vehicle signals** - Ignition and battery information when the tracker provides it

Vehicle details

Each vehicle has a profile you can manage: name, plate number, vehicle type (car, bike, van, truck, and similar), photo, fuel type, and average fuel use while driving and while idling. You can also set a personal speed limit and harsh-driving sensitivity for that vehicle.

Why it matters

A dispatch or operations person can answer "Where is vehicle X?" in seconds, without calling the driver - and spot idle time or unexpected stops early.

4. Trip History & Playback

Automatic trip logging

As vehicles leave and return through their assigned home area (geofence), the system records trips automatically. Each trip captures start and end time, distance, duration, fuel estimates, and driving behavior metrics.

- **When & where** - Start and end time and locations
- **Distance & duration** - Distance traveled and time on the road
- **Fuel** - Estimated fuel used while driving and while idling, plus fuel cost
- **Extra costs** - Optional toll and challan (fine) amounts you can record
- **Driving behavior** - Max speed, overspeed events, harsh braking and acceleration, idle counts

Confirm driver and route

After a trip, Admin or Manager can confirm who actually drove and which planned route was used. Confirmation is separate from the vehicle's usual driver assignment, so temporary swaps (borrowing a driver) are handled cleanly.

- **Driver confirmation** - Who drove this trip (with optional borrow-from-another-vehicle support)
- **Route confirmation** - Which planned route this trip followed
- **Pending alerts** - Reminders when a trip still needs confirmation

Live playback

Playback lets you rewind a vehicle's journey for a chosen time range. You can watch the path on the map - useful for investigating complaints, verifying deliveries, or reviewing an incident.

5. Geofences (Allowed Areas)

A geofence is a virtual boundary drawn on the map - for example a depot, warehouse, customer site, or city zone. Vehicles can be linked to a primary geofence so the system knows their "home" area.

- **Create zones** - Draw and name areas on the map
- **Assign vehicles** - Link a vehicle to its primary (home) geofence
- **Exit alerts** - Get a critical alert when a vehicle leaves its assigned area
- **Trip boundaries** - Use geofences to help start and complete trip records

Business example

If a delivery van should stay within a city zone, leaving that zone can raise an alert immediately so a supervisor can check in with the driver.

6. Planned Routes

Routes are paths you expect vehicles to follow (for example depot -> customer A -> customer B -> depot). You can create a route, preview it on the map, assign vehicles to it, and later see how closely actual trips matched the plan.

- **Design routes** - Create start/end (and via) points and preview the path
- **Assign vehicles** - Assign one or more vehicles to a route
- **Match trips** - See how closely a trip followed the planned path (match percentage)
- **Find deviations** - Spot deviation segments where the vehicle left the planned path
- **Route deviation alerts** - Alert when significant route deviation is detected

Confirming a route on a trip records which planned route was actually used for that journey, without changing

the vehicle's long-term assignment.

7. Driver Management

Keep a driver roster with identity and license details, then assign drivers to vehicles. Assignment history is retained so you can see who was on which vehicle over time.

- **Driver profile** - Name, CNIC / ID card number, phone, license number and expiry
- **Status** - Active, inactive, or on leave
- **Documents** - Photo and license scan uploads
- **Vehicle assignment** - Assign / unassign a driver to a vehicle
- **History** - View assignment history and driver detail pages
- **Unassigned driver alert** - Alert when a trip is in progress but no driver is assigned

8. Alerts & Notifications

The system watches vehicle behavior continuously and raises alerts when something needs attention. Alerts can be turned on or off by type at the fleet level, and each person can choose which types ring their notification bell.

Alert types you can monitor

- **Overspeed** - Vehicle exceeds its speed limit (fleet default or per-vehicle)
- **Harsh driving** - Sudden hard braking or hard acceleration
- **Geofence exit** - Vehicle leaves its primary geofence
- **Route deviation** - Vehicle strays significantly from its planned route
- **Silence / offline** - Mobile tracker stops reporting (possible theft / signal loss)
- **Driver unassigned** - A trip is running without a driver assigned
- **Pending confirmation** - Trip still needs driver or route confirmation
- **Maintenance due** - Service items approaching due or already overdue

How alerts are handled

- **Inbox** - Open alerts appear in a notifications / alerts feed
- **Priority** - Severity helps prioritize (for example critical vs warning)
- **Resolve** - Authorized users can resolve alerts when the issue is handled
- **Personal prefs** - Per-person preferences control which alert types notify them

Why it matters

You do not need to stare at the map all day. The system watches for you and surfaces problems - speeding, unauthorized exits, missing drivers, overdue service - so the right person can act quickly.

9. Dashboards & Reports

At-a-glance dashboard

Admin and Manager dashboards summarize fleet health for a selected period: how many vehicles are active, trip counts, alert volumes, and maintenance status. Trend charts show how activity and issues change over time.

- **Operations snapshot** - Vehicle and trip activity overview
- **Safety pulse** - Alert counts and recent issues
- **Maintenance status** - Vehicles due or overdue for maintenance
- **Trends** - Trends over days or weeks for trips, alerts, and service

Vehicle reports

For a chosen vehicle and date range, reports summarize distance, speeds, idle behavior, harsh events, overspeeding, and related metrics - useful for performance reviews, fuel discussions, and safety coaching.

10. Vehicle Maintenance

Maintenance helps you stop relying on memory or paper logs. Each vehicle can track service items (engine oil, filters, and similar catalog items) by distance and/or engine hours, with defaults by vehicle type and optional per-vehicle overrides.

- **Baseline setup** - Set a starting baseline (odometer / engine hours) for each vehicle
- **Due status** - See what is OK, due soon, or overdue
- **Service records** - Log workshop visits with date, odometer, costs, notes, and line items
- **Custom intervals** - Adjust intervals per vehicle when needed
- **Reminders** - Receive maintenance alerts before and after items become overdue
- **History & cost** - Review maintenance history and cost over time

Business example

Instead of discovering a missed oil change after a breakdown, the dashboard shows "due soon" early enough to schedule the workshop visit.

11. Fuel Types & Prices

Admins can maintain fuel types and current (and historical) fuel prices. Combined with each vehicle's average consumption figures, trip records can estimate fuel used and fuel cost in local currency - helping you understand operating cost per trip and over time.

- **Fuel types** - Define fuel types used by the fleet
- **Price history** - Record price updates over time
- **Trip fuel estimates** - Estimate driving and idle fuel use on trips
- **Cost visibility** - See estimated fuel cost on completed trips

12. People, Permissions & Access

Users and vehicle ownership

Users are people in your organization. A user can own one vehicle. Managers oversee groups of users (and through them, those users' vehicles). Admins run the whole fleet.

Permissions (what someone is allowed to do)

Permissions are fine-grained. Admins decide which capabilities Managers (and, where applicable, Users) receive. Examples include:

- **Live tracking** - View live map and positions
- **Alerts & notifications** - View and resolve alerts
- **Trip history** - View trip history
- **Vehicle management** - Manage vehicles
- **Driver management** - Manage drivers and assignments
- **User management** - Manage users
- **Geofence management** - Create and edit geofences
- **Route management** - Create and edit routes
- **Maintenance** - Log and edit maintenance
- **Fuel prices** - Manage fuel prices
- **Reports & analytics** - View reports and analytics

Secure sign-in

People sign in with their own account. Sessions can be refreshed securely. Access is limited to the fleet and the permissions attached to that account.

13. Settings & Preferences

- **Alert type settings** - Turn alert types on/off for the whole fleet
- **Offered notifications** - Choose which alert types Managers may receive
- **Permission catalog** - Maintain the permission catalog and defaults for new people
- **My preferences** - Personal notification preferences (which bells ring for me)
- **Display prefs** - Dashboard appearance and period filters for viewing trends
- **Responsive design** - Works on desktop and mobile browsers

14. Multi-Fleet Organization

The platform supports multiple fleets (tenants). Each Admin's fleet is isolated: vehicles, users, drivers, geofences, routes, and trips belong to that fleet. A Super Admin can oversee Admins and help with unassigned assets, without mixing one company's data into another's day-to-day view.

Privacy & clarity

Managers and Users only see the people and vehicles in their scope. That keeps screens simpler and protects information that should stay within a team.

15. Benefits at a Glance

- **Visibility** - Always know where the fleet is - without phone calls.
- **Safety** - Catch speeding, harsh driving, and unauthorized exits early.
- **Security** - Reduce theft risk with silence / offline monitoring on mobile trackers.
- **Accountability** - Prove where a vehicle went with playback and trip records.
- **Operations discipline** - Confirm drivers and routes for cleaner operations records.
- **Cost awareness** - Estimate fuel use and cost per trip.
- **Asset care** - Keep service on schedule and record workshop history.
- **Controlled access** - Give each role only the tools they need.
- **Anywhere access** - Use one system on computer or phone.

16. Typical Daily Workflow

A simple picture of how teams use Fleet Tracker day to day:

- **Morning** - Open the dashboard and map; check which vehicles are moving, idle, or offline.
- **During the day** - Respond to any open alerts (overspeed, geofence exit, unassigned driver, etc.).
- **After trips** - Confirm drivers/routes on completed trips; review playback if something looks wrong.
- **Ongoing** - Check maintenance due list and schedule workshop visits; log completed service.
- **Weekly / monthly** - Review trends and vehicle reports for coaching and planning.

Ready to see more?

This guide describes the product features available in Fleet Tracker. For a live walkthrough, ask your system administrator or implementation partner to demonstrate the Admin, Manager, and User views with your own vehicles.

Document purpose: non-technical product overview for stakeholders. Feature availability depends on role permissions and fleet configuration.
